Avoid

Backup to CD/DVD – this is not fully automatic, and the medium is not very robust Any 'backup' that is not fully automatic – remember that you may go for years without any issue. RAID – RAID arrays provide redundancy and increases up-time, but if a file is corrupt on one drive, it is also gone on all drives that from the array.

A backup plan that does not incorporate both on-site and off-site solutions will be vulnerable. It would not matter how many local backups you have if fire or theft occurred.
